

# Welcome

**Maturity:** [experimental](#) (Please read our advices about using [experimental](#) research results before using this project.)

R-IOSUITE is an open source software project under [AGPLv3](#).

---

**RIO-SUITE is a software suite that embeds a set of tools dedicated to support efficiently inter-organizational collaborations (collaborative industrial projects, supply chain, crisis management, etc).**

RIO-Suite is based on a model-driven architecture: the data is gathered and used to define situational models - describing the objectives, the context, the risks and difference measure associated to the collaboration and the capabilities and the resources of the involved organizations - that are then used for different purpose

(visualization of the collaborative situation, monitoring of the collaboration, risks management, etc.).
